

ABSTRACT OF THE DISCLOSURE

A biosensor in the form of a strip. In one embodiment, the biosensor strip comprises an electrode support, a first electrode, i. e., a working electrode, a second

5 electrode, i.e., a counter electrode, and a third electrode, i.e., a reference electrode.

Each of the electrodes is disposed on and supported by the electrode support.

Each of the electrodes is spaced apart from the other two electrodes. The biosensor strip can include a covering layer, which defines an enclosed space over the electrodes. This enclosed space includes a zone where an analyte in the sample

10 reacts with reagent(s) deposited at the working electrode. This zone is referred to as the reaction zone. The covering layer has an aperture for receiving a sample for introduction into the reaction zone. The biosensor strip can also include at least one layer of mesh interposed in the enclosed space between the covering layer and the electrodes in the reaction zone. This layer of mesh facilitates transporting of the

15 sample to the electrodes in the reaction zone. In another embodiment, a biosensor strip can be constructed to provide a configuration that will allow the sample to be introduced to the reaction zone by action of capillary force. In this embodiment, the layer of mesh can be omitted. The invention also provides a method for determining the concentration of glucose in a sample of whole blood by using the biosensor of
20 this invention.
